The conductive surface is used in a circuit path to determine when the abrading rod has penetrated the PTFE layer.
- f. Test method:

- (1) Install a .026 inch (0.66 mm) edged abrading rod with the edged surface facing down (perpendicular with the test specimen).
- (2) Remove approximately 1 inch (25.4 mm) of insulation from the end of the specimen and connect the circuit detection clip to the exposed conductor.
- (3) Apply the appropriate weights to the fixture.
- (4) Place the abrading rod on the specimen, ensuring the rod is level and perpendicular to the specimen surface.
- (5) Zero the counter on the abrasion tester.
- (6) Turn the tester on. The rod will begin to oscillate over the surface of the specimen with an approximate 1 inch (25.4 mm) stroke.
- (7) The test will continue until the tester detects continuity between the abrading rod and the conductor.
- (8) Record the number of cycles to failure.
- (9) Repeat the procedure a minimum of 10 times (100 times preferred) to generate a statistically significant sample.
- (10) Average the results.
